Neuropeptide Y antagonists.

Antagonists of NPY which are derivatives of naturally occurring NPY. The antagonism is confirmed using conventional competitive binding and biochemical assays and the use of these derivatives in a variety of conditions in which neuropeptide Y is implicated is also described.

Exhibit 23

## NEUROPEPTIDE Y ANTAGONISTS

This invention relates to novel peptide derivatives which are antagonists of neuropeptide Y.

Porcine neuropeptide Y (pNPY) is a 36 amino acid residue peptide that belongs to a unique family of peptides having a wide distribution throughout the central and peripheral nervous systems. Receptors for NPY are found in the central nervous system and in the periphery. In the brain, NPY is a potent stimulator of food intake, stimulates luteinizing hormone, growth hormone and prolactin, and produces cardiovascular depression. NPY is also a potent peripheral vasoconstrictor and has been reported to cause transient myocardial ischaemia in patients with angina pectoris. Antagonism of these effects is expected to result in reduced blood pressure and accordingly antagonists of NPY are expected to be useful in the treatment of hypertension, vasospasm, and angina, and useful for the suppression of appetite. NPY has been shown to be a potent bronchoconstrictor and has been implicated in the regulation of the resting tone of airways. NPY antagonists would block the NPY induced constriction and result in bronchodilation.

Novel peptide derivatives of formula 1 Y-P-S-

wherein

X<sub>2</sub> is S or A;

X<sub>3</sub> is S or A;

X<sub>4</sub> is L, I, M, Nle, or V;

X<sub>5</sub> is L, I, M, Nle, or V;

Tc is OR or NHR;

wherein R is a hydrogen or a (C<sub>1-4</sub>) alkyl group;

$\epsilon$  is a group of the structural formula  $-\text{NH}(\text{CH}_2)_n - \text{CO}_2-$ ;

wherein n is an integer of from 1-11 and the pharmaceutically acceptable salts thereof are antagonists of neuropeptide Y. These peptide derivatives inhibit NPY-induced contractions of mouse spleen.

The following common abbreviations of the amino acids and amino and carboxy terminal groups are used throughout this specification:

Ala (or A) - alanine

Val (or V) - valine

Leu (or L) - leucine

Ile (or I) - isoleucine

Pro (or P) - proline

Met (or M) - methionine

Ser (or S) - serine

Thr (or T) - threonine

Cys (or C) - cysteine

cys (or c) - D-cysteine

Tyr (or Y) - tyrosine

Asn (or N) - asparagine

Asp (or D) - aspartic acid

Lys (or K) - lysine

Arg (or R) - arginine

5 His (or H) - histidine

Nle - norleucine

Aoc - 8-aminooctanoic acid

$\epsilon$  -  $-\text{NH}_2$

10 An alkyl group is taken to include straight, branched, or cyclic alkyl groups, for example, methyl, ethyl, propyl, isopropyl, butyl, isobutyl, tert-butyl, pentyl, isopentyl, sec-pentyl, cyclopentyl, hexyl, isohexyl, cyclohexyl and cyclopentylmethyl. An acyl group of from 2 to 10 carbon atoms is  
15 taken to include straight, branched, cyclic, saturated and unsaturated acyl groups having 1 or 2 carbonyl moieties per group, for example, acetyl, benzoyl, succinyl, maleyl, and glutaryl. Those peptides wherein the amino group of the amino terminal amino acid is substituted with two alkyl or acyl  
20 groups are also considered to be within the scope of the peptides of this invention.

The natural amino acids, with the exception of glycine, contain a chiral carbon atom. Unless otherwise specifically indicated, the optically active amino acids, referred to herein, are of the L-configuration.

The polypeptides of formula 1 can form pharmaceutically acceptable salts with any non-toxic, organic or inorganic acid. Illustrative inorganic acids which form suitable salts include hydrochloric, hydrobromic, sulphuric and phosphoric acid and acid metal salts such as sodium monohydrogen orthophosphate and potassium hydrogen sulfate.  
35 Illustrative organic acids which form suitable salts include the mono, di and tricarboxylic acids. Illustrative of such acids are, for example, acetic, glycolic, lactic, pyruvic, malonic, succinic, glutaric, fumaric, malic, tartaric, citric, ascorbic, maleic, hydroxymaleic, benzoic, hydroxybenzoic, phenylacetic, cinnamic, salicylic, 2-phenoxybenzoic and sulfonic acids such as methane sulfonic acid and 2-hydroxyethane sulfonic acid. Salts of the carboxy terminal amino acid moiety include the  
45 non-toxic carboxylic acid salts formed with any suitable inorganic or organic bases. Illustratively, these salts include those of alkali metals, as for example, sodium and potassium; alkaline earth metals, such as calcium and magnesium; light metals of Group IIIA including aluminum; and organic primary, secondary and tertiary amines, as for example, trialkylamines, including triethylamine, procaine, dibenzylamine, 1-ethenamine, N,N'-dibenzylethylenediamine, dihydroabietylamine, N-(lower)-alkylpiperidine, and any other suitable amine.  
50

As with any generic group of chemical compounds, certain groups are preferred. Applicants prefer those peptide derivatives of formula 1 wherein  $X_2$  is alanine (A). Applicants also prefer those peptide derivatives of formula 1 wherein  $X_2$  is serine (S), as well as those peptide derivatives of formula 1 wherein  $X_4$  or  $X_5$  is isoleucine (I), wherein  $T_c = NH_2$  and wherein  $v$  is Anc. The most preferred peptide derivative of formula 1 is the peptide derivative of formula 2.

**Y-P-S-K-P-D-c -Aoc-A-R-C-Y-S-A-L-R-H-Y-I-N-L-I-T-R-I-R-Y-S 2**

The proteins of this invention can be prepared by a variety of procedures readily known to those skilled in the art. Such procedures include the solid phase sequential procedure which can be performed using established automated methods such as by use of an automated peptide synthesizer.

The resin support employed can be any suitable resin conventionally employed in the art for the solid phase preparation of polypeptides, preferably polystyrene which has been cross-linked with from 0.5 to about 3 percent divinyl benzene, which has been either converted to the p-methylbenzhydrylamine or benzhydrylamine derivative (for C-terminal amides) or chloromethylated or hydroxymethylated to provide sites for ester formation with the initially introduced  $\alpha$ -amino protected amino acid (for producing C-terminal alkylamides) and esters.

An example of a hydroxymethyl resin is described by Bodanszky, et al., *Chem. Ind. (London)* 38, 1597-98 (1966). A chloromethylated resin is commercially available from Bio Rad Laboratories, Richmond, California, and the preparation of such a resin is described by Stewart et al., "Solid Phase Peptide Synthesis" (Freeman & Co., San Francisco 1969), Chapter 1, pp. 1-6. The protected amino acid can be bound to the resin by the procedure of Gisin, *Helv. Chem. Acta*, 56, 1478 (1973). Many resin bound, protected amino acids are commercially available. As an example, to prepare a polypeptide of this invention wherein the carboxy terminal end is a Thr residue, a tert-butyloxycarbonyl (Boc) protected Thr bound to a benzylated, hydroxymethylated phenylacetamidomethyl (PAM) resin can be used and is commercially available.

Following the coupling of the  $\alpha$ -amino protected amino acid to the resin support, the protecting group is removed using any suitable procedure such as by using trifluoroacetic acid in methylene chloride, trifluoroacetic acid alone, or HCl in dioxane. The deprotection is carried out at a temperature of between 0°C and room temperature. Other standard cleaving reagents and conditions for removal of specific  $\alpha$ -amino protecting groups may

be used. After removal of the  $\alpha$ -amino protecting group the other amino protected amino acids are coupled step-wise in the desired order. Alternatively, multiple amino acid groups may be coupled by the solution method prior to coupling with the resin supported amino acid sequence.

The  $\alpha$ -amino protecting group employed with each amino acid introduced into the polypeptide sequence may be any such protecting group known to the art. Among the classes of  $\alpha$ -amino protecting groups contemplated are (1) acyl type protecting groups such as: formyl, trifluoroacetyl, phthalyl, toluenesulfonyl (tosyl), benzenesulfonyl, nitro-phenylsulfonyl, tritylsulfonyl, o-nitrophenoxycetyl and  $\alpha$ -chlorobutyryl; (2) aromatic urethan type protecting groups such as benzyloxycarbonyl and substituted benzyloxycarbonyl, such as p-chlorobenzyloxycarbonyl, p-nitrobenzyl-, carbonyl, p-bromobenzyloxycarbonyl, p-methoxybenzyloxycarbonyl, 1-(p-biphenyl-yl)-1-methylethoxycarbonyl,  $\alpha$ ,  $\alpha$ -dimethyl-3,5-dimethoxybenzyloxycarbonyl and benzhydryloxycarbonyl, 9-fluorenylmethoxycarbonyl (Fmoc); (3) aliphatic urethan protecting groups such as tert-butyloxycarbonyl (Boc), diisopropylmethoxycarbonyl, isopropyloxycarbonyl, ethoxycarbonyl and allyloxycarbonyl; (4) cycloalkyl urethan type protecting groups such as cyclopentylloxycarbonyl, adamantylloxycarbonyl and cyclohexylloxycarbonyl; (5) thio urethan type protecting groups such as phenylthiocarbonyl; (6) alkyl type protecting groups such as triphenylmethyl (trityl) and benzyl; and (7) trialkylsilane groups such as trimethylsilane. The preferred  $\alpha$ -amino protecting group is tert-butyloxycarbonyl and Fmoc.

The selection of an appropriate coupling reagent is within the skill of the art. A particularly suitable coupling reagent where the amino acid to be added is Gln, Asn or Arg is N,N'-diisopropylcarbodiimide and 1-hydroxybenzotriazole. The use of these reagents prevents nitrile and lactam formation. Other coupling agents are (1) carbodiimides (e.g., N,N'-dicyclohexylcarbodiimide and N-ethyl-N-( $\gamma$ -dimethylaminopropyl)carbodiimide); (2) cyanamides (e.g., N,N-dibenzylcyanamide); (3) ketenimines; (4) isoxazolium salts (e.g., N-ethyl-5-phenylisoxazolium-3-sulfonate); (5) monocyclic nitrogen containing heterocyclic amides of aromatic character containing one through four nitrogens in the ring such as imidazolides, pyrazolides, and 1,2,4-triazolides. Specific heterocyclic amides that are useful include N,N'-carbonyldiimidazole and N,N'-carbonyl-di-1,2,4-triazole; (6) alkoxylated acetylene (e.g., ethoxy acetylene); (7) reagents which form a mixed anhydride with the carboxyl moiety of the amino acid (e.g., ethylchloroformate and isobutylchloroformate) or the symmetrical anhydride of the amino acid to be coupled (e.g., (Boc-Ala)<sub>2</sub>-O) and (8) nitrogen containing

heterocyclic compounds having a hydroxy group on one ring nitrogen (e.g., N-hydroxyphthalimide, N-hydroxysuccinimide and 1-hydroxybenzotriazole). Other activating reagents and their use in peptide coupling are described by Kapoor J. *Pharm. Sci.*, 59, pp. 1-27 (1970). Applicant prefers the use of the symmetrical anhydride as a coupling reagent for all amino acids except Arg, Asn and Gln.

Each protected amino acid or amino acid sequence is introduced into the solid phase reactor in about a four-fold excess and the coupling is carried out in a medium of dimethylformamide-methylene chloride (1:1) or in dimethylformamide alone or preferably methylene chloride alone. In cases where incomplete coupling occurs, the coupling procedure is repeated before removal of the  $\alpha$ -amino protecting group, prior to the coupling of the next amino acid in the solid phase reactor. The success of the coupling reaction at each stage of the synthesis is monitored by the ninhydrin reaction as described by E. Kaiser et al. *Analyt. Biochem.* 34, 595 (1970).

After the desired amino acid sequence has been obtained, the peptide is removed from the resin. This can be done by hydrolysis such as by treatment of the resin-bound polypeptide with a solution of dimethyl sulfoxide, p-cresol and thiocresol in liquid hydrofluoric acid.

As is known in the art of solid phase peptide synthesis many of the amino acids bear functionalities requiring protection during the chain preparation. The use and selection of the appropriate protecting group is within the ability of those skilled in the art and will depend upon the amino acid to be protected and the presence of other protected amino acid residues on the peptide. The selection of such a side chain protecting group is critical in that it must be one which is not removed during cleavage of the protecting group of the  $\alpha$ -amino moiety. For example, suitable side chain protecting groups for lysine are benzyloxycarbonyl and substituted benzyloxycarbonyl, said substituent being selected from halo (e.g., chloro, bromo, fluoro) and nitro (e.g., 2-chlorobenzyloxycarbonyl, p-nitrobenzyloxycarbonyl, 3,4-dichlorobenzyloxycarbonyl), tosyl, t-amylloxycarbonyl, t-butyloxycarbonyl and diisopropylmethoxycarbonyl. The alcoholic hydroxyl group of threonine and serine can be protected with an acetyl, benzoyl, tert-butyl, trityl, benzyl, 2,6-dichlorobenzyl or benzyloxycarbonyl group. The carboxylic group of Aspartic acid and Glutamic acid can be protected with a benzyl or cyclonexyl group. The preferred protecting group is benzyl.

These groups can be removed by procedures well known in the art. Typically protecting group removal is done after the peptide chain synthesis is

complete but the protecting groups can be removed at any other appropriate time.

The ability of the peptide derivatives of formula 1 to act as antagonists of neuropeptide Y can be demonstrated by the ability of such peptides to compete with iodinated neuropeptide Y for receptors using the method of Lundberg et al. *Eur. J. Pcol.* 145:21-9 (1988). <sup>125</sup>I-Bolton-Hunter-neuropeptide Y (BHNPY, Amersham) binding was carried out in pig spleen crude membranes. Membranes from frozen spleen were prepared as described previously for tachykinin peptide binding studies (Buck et al., 1984). An aliquot of membrane preparation (approximately 15 mg tissue) was incubated at room temperature for 2 hr in buffer (pH 7.4) containing the peptide analog, 130 mM NaCl, 2.7 mM KCl, 2 mM MgCl<sub>2</sub>, 1.8 mM CaCl<sub>2</sub>, 20 mM HEPES, 4 mg/ml BSA, 40  $\mu$ g/ml bacitracin, 4  $\mu$ g/ml leupeptin and 4  $\mu$ g/ml chymostatin. BHNPY was included in a concentration of 0.1 nM and non-specific binding was determined by the inclusion of 1  $\mu$ M pNPY. Samples were rapidly filtered over Whatman GFC filters presoaked overnight in 0.5% histone (type II-AS, Sigma) and washed two times with ice-cold, plain HEPES-salt buffer (pH 7.4). IC<sub>50</sub> values for test peptides were calculated from 6 to 10 point competition curves. Utilizing this procedure the peptide derivative of Example 1 was found to have an IC<sub>50</sub> of < 300 nM.

By virtue of the ability of the peptide derivatives of this invention to act as antagonists of neuropeptide Y, the compounds possess valuable pharmacologic properties such as hypotensive, vasospasm, vasodilating and antihypertensive activity as well as depression of food intake desire and depression of luteinizing hormone secretion. Significant medical uses of the NPY antagonists of this invention are as antihypertensive agents, anti-anginal agents, antivasospasmodics and as appetite depressants.

The dose of a peptide derivative of this invention required to antagonize neuropeptide Y and therefore produce a hypotensive, antihypertensive, vasodilator or other pharmacological or medical effect is from 0.2 mg/kg to 250 mg/kg of patient body weight per day depending on the patient, the severity of the thrombotic condition to be treated and the peptide derivative selected. The suitable dose for a particular patient can be readily determined. Preferably from 1 to 4 daily doses would be administered typically with from 5 mg to 100 mg of active compound per dose.

Hypotensive, antihypertensive, and vasodilator therapy is indicated for the treatment and prevention of a variety of conditions, particularly coronary artery and cerebrovascular disease such as hypertension and angina. Those experienced in this field are readily aware of the circumstances requir-

ing such therapy. The term "patient" used herein is taken to mean mammals such as primates, including humans, sheep, horses, cattle, pigs, dogs, cats, rats and mice.

Although some of the peptide derivatives may survive passage through the gut following oral administration, applicants prefer non-oral administration, for example, subcutaneous, intravenous, intramuscular or intraperitoneal; administration by depot injection; by implant preparation; or by application to the mucous membranes, such as, that of the nose, throat and bronchial tubes, for example, in an aerosol containing a peptide derivative of this invention in a spray or dry powder form.

For parenteral administration the compounds may be administered as injectable dosages of a solution or suspension of the compound in a physiologically acceptable diluent with a pharmaceutical carrier which can be a sterile liquid such as water and oils with or without the addition of a surfactant and other pharmaceutically acceptable adjuvants. Illustrative of oils which can be employed in these preparations are those of petroleum, animal, vegetable, or synthetic origin, for example, peanut oil, soybean oil, and mineral oil. In general, water, saline, aqueous dextrose and related sugar solutions, ethanol and glycols such as propylene glycol or polyethylene glycol are preferred liquid carriers, particularly for injectable solutions.

The compounds can be administered in the form of a depot injection or implant preparation which may be formulated in such a manner as to permit a sustained release of the active ingredient. The active ingredient can be compressed into pellets or small cylinders and implanted subcutaneously or intramuscularly as depot injections or implants. Implants may employ inert materials such as biodegradable polymers or synthetic silicones, for example, Silastic, silicone rubber manufactured by the Dow-Corning Corporation.

### EXAMPLES

This invention is illustrated by the following, nonlimiting examples

#### EXAMPLE 1

#### PREPARATION OF

#### T-R-I-R-Y-#

The title peptide derivative was synthesized on a 0.5 mmol scale by solid-phase methods on p-methylbenzhydrylamine resin (0.40 mmol/g; Peptides Intl.) using an Applied Biosystems Model 430-A Peptide Synthesizer. All residues were double coupled as the symmetrical anhydrides of the N<sup>α</sup>-t-Boc-protected amino acids with the exception of Arg and Asn which were double coupled by the DCC-HOBT methodology. The side chain protection was as follows: Arg(Tos), Asp(Chx), Cys(pMeBzl), His(Tos), Ser(Bzl), Tyr(2-BrZ), Lys(2-ClZ), Thr(Bzl). The peptides (0.25 mmol theory) were cleaved from the resin-support and deprotected in liquid HF containing 5% anisole at -5°C for 40 min. After removal of the HF *in vacuo* the peptide was extracted from the resin with 30% acetic acid and water. The extract was diluted to 1 liter, the pH adjusted to between 8 and 9 with ammonium hydroxide and 0.01 N potassium ferricyanide was added until a yellow color persisted (approx. 25 ml). After stirring for 30 min, the pH was lowered to <5 with glacial acetic acid and the solution was stirred with 25 ml of settled AG 3-X4A resin (Bio-Rad) for 2 hours. The solution was filtered from the resin and lyophilized. The peptidic material that remained was purified by preparative HPLC on a Dynamax C-18 column (41.4 x 250 mm; Rainin) using acetonitrile in 0.1% trifluoroacetic acid as an eluant. The purity and identity of the peptide were assessed by analytical HPLC (Vydac 218TP54 column, 4.6 x 250 mm, 2.0 ml/min, t<sub>R</sub> = 1.9 min, linear gradient of 15-40% acetonitrile in 0.1% TFA over 25 min), amino acid analysis (AAA) (6 N HCl containing 8% phenol; 106°C, 20 and 40 hr) and fast atom bombardment-mass spectrometry (FAB-MS) (M-Scan Ltd.)

AAA: B-1.96, T-1.03, S-1.62, P-1.88, A-1.96, I-2.84, L-2.14, Y-4.04, H-1.09, R-4.06  
 46 16N HCl, 24 Hr, 106°C  
 FAB-MS (M+H)<sup>+</sup> 3311.2 ± 1 mu.

#### Claims

1. A peptide derivative of the formula

wherein

X<sub>2</sub> is S or A,

X<sub>3</sub> is S or A,

X<sub>4</sub> is L, I, M, Nie, or V

X<sub>5</sub> is L, I, M, Nie, or V

Tc is OR or NHR

wherein R is a hydrogen or a (C=O)-alkyl group  
 5 and 9 is a group of the structural formula -NH-CH(R)-

CO<sub>2</sub>;

wherein n is an integer of from 1-11, or a pharmaceutically acceptable salt thereof.

2. The peptide derivative of claim 1 wherein X<sub>2</sub> is A.

3. The peptide derivative of claim 1 or 2 wherein X<sub>2</sub> is S.

4. The peptide derivative of any one of claims 1 to 3 wherein X<sub>4</sub> is I.

5. The peptide derivative of any one of claims 1 to 4 wherein X<sub>5</sub> is I.

6. The peptide derivative of any one of claims 1 to 5 wherein θ is Aoc.

7. The peptide derivative of any one of claims 1 to 6 wherein Tc is NH<sub>2</sub>.

8. The peptide derivative of claim 1 which is

9. A process for preparing a peptide derivative of any one of claims 1 to 8 which comprises binding a suitably protected tyrosine to an activated resin support, subsequently binding the other alpha amino protected amino acids from proline to the carboxy terminal tyrosine to the terminal amino group of the growing peptidic chain which has meanwhile been exposed by removing its amino protecting group, cleaving the protected peptide from the resin, removing any protecting groups, subjecting the linear peptide to an oxidative coupling, and finally isolating the cyclized peptide or a pharmaceutically acceptable salt thereof.

10. A peptide derivative or a pharmaceutically acceptable salt thereof according to any one of claims 1 to 8 or a mixture thereof for use as a pharmaceutically active compound.

11. A peptide derivative or a pharmaceutically acceptable salt thereof according to any one of claims 1 to 8 or a mixture thereof for the treatment of disorders requiring antagonizing a neuropeptide Y receptor.

12. A peptide derivative or a pharmaceutically acceptable salt thereof according to any one of claims 1 to 8 or a mixture thereof for the treatment of hypertension.

13. A peptide derivative or a pharmaceutically acceptable salt thereof according to any one of claims 1 to 8 or a mixture thereof for the treatment of angina.

14. A peptide derivative or a pharmaceutically acceptable salt thereof according to any one of claims 1 to 8 or a mixture thereof for the suppression of appetite.

15. A peptide derivative or a pharmaceutically acceptable salt thereof according to any one of claims 1 to 8 or a mixture thereof for the treatment of vasospasm.

16. A pharmaceutical composition containing a

peptide derivative or a pharmaceutically acceptable salt thereof according to any one of claims 1 to 8 or a mixture thereof and optionally a pharmaceutically acceptable carrier and/or diluent.

17. The pharmaceutical composition according to claim 16 for the treatment of disorders requiring antagonizing a neuropeptide Y receptor, of hypertension, of angina, the suppression of appetite, or the treatment of vasospasm.

Claims for the following Contracting State: GR

1. A peptide derivative of the formula

wherein

X<sub>2</sub> is S or A;

X<sub>3</sub> is S or A;

X<sub>4</sub> is L, I, M, Nle, or V;

X<sub>5</sub> is L, I, M, Nle, or V;

Tc is OR' or NHR';

wherein R' is a hydrogen or a (C<sub>1</sub>-C<sub>4</sub>) alkyl group;

θ is a group of the structural formula  $\text{-NH-(CH}_2\text{)}_n\text{-}$

CO<sub>2</sub>;

wherein n is an integer of from 1-11, or a pharmaceutically acceptable salt thereof.

2. The peptide derivative of claim 1 wherein X<sub>2</sub> is A.

3. The peptide derivative of claim 1 or 2 wherein X<sub>2</sub> is S.

4. The peptide derivative of any one of claims 1 to 3 wherein X<sub>4</sub> is I.

5. The peptide derivative of any one of claims 1 to 4 wherein X<sub>5</sub> is I.

6. The peptide derivative of any one of claims 1 to 5 wherein θ is AOC.

7. The peptide derivative of any one of claims 1 to 6 wherein Tc is NH<sub>2</sub>.

8. The peptide derivative of claim 1 which is

9. A process for preparing a peptide derivative of any one of claims 1 to 8 which comprises binding a suitably protected tyrosine to an activated resin support, subsequently binding the other alpha amino protected amino acids from proline to the carboxy terminal tyrosine to the terminal amino group of the growing peptidic chain which has meanwhile been exposed by removing its amino protecting group, cleaving the protected peptide from the resin, removing any protecting groups, subjecting the linear peptide to an oxidative coupling, and finally isolating the cyclized peptide or a pharmaceutically acceptable salt thereof

10. A peptide derivative or a pharmaceutically

acceptable salt thereof according to any one of claims 1 to 8 or a mixture thereof for use as a pharmaceutically active compound.

11. A peptide derivative or a pharmaceutically acceptable salt thereof according to any one of claims 1 to 8 or a mixture thereof for the treatment of disorders requiring antagonizing a neuropeptide Y receptor.

12. A peptide derivative or a pharmaceutically acceptable salt thereof according to any one of claims 1 to 8 or a mixture thereof for the treatment of hypertension.

13. A peptide derivative or a pharmaceutically acceptable salt thereof according to any one of claims 1 to 8 or a mixture thereof for the treatment of angina.

14. A peptide derivative or a pharmaceutically acceptable salt thereof according to any one of claims 1 to 8 or a mixture thereof for the suppression of appetite.

15. A peptide derivative or a pharmaceutically acceptable salt thereof according to any one of claims 1 to 8 or a mixture thereof for the treatment of vasospasm.

Claims for the following Contracting State: ES

1. A process for preparing a peptide derivative of the formula

wherein

$X_2$  is S or A;

$X_3$  is S or A;

$X_4$  is L, I, M, Nle, or V;

$X_5$  is L, I, M, Nle, or V;

Tc is OR or NHR;

wherein R is a hydrogen or a (C<sub>1</sub>-C<sub>4</sub>) alkyl group.

$\epsilon$  is a group of the structural formula  $-NH-(CH_2)_n-CO_2-$

wherein n is an integer of from 1-11.

which comprises binding a suitably protected tyrosine to an activated resin support, subsequently binding the other alpha amino protected amino acids from proline to the carboxy terminal tyrosine to the terminal amino group of the growing peptidic chain which has meanwhile been exposed by removing its amino protecting group, cleaving the protected peptide from the resin, removing any protecting groups, subjecting the linear peptide to an oxidative coupling, and finally isolating the cyclized peptide or a pharmaceutically acceptable salt thereof.

2. The process of claim 1 wherein  $X_2$  is A.

3. The process of claim 1 or 2 wherein  $X_3$  is S.

4. The process of any one of claims 1 to 3

wherein  $X_4$  is I.

5. The process of any one of claims 1 to 4 wherein  $X_5$  is I.

6. The process of any one of claims 1 to 5 wherein B is Aoc.

7. The process of any one of claims 1 to 6 wherein Tc is NH<sub>2</sub>.

8. The process of claim 1 which is

9. Use of a peptide derivative or a pharmaceutically acceptable salt thereof obtainable according to a process of any one of claims 1 to 8 or of a mixture thereof for the preparation of a pharmaceutical composition.

10. Use of a peptide derivative or a pharmaceutically acceptable salt thereof obtainable according to a process of any one of claims 1 to 8 or of a mixture thereof for the preparation of a pharmaceutical composition for the treatment of disorders requiring antagonizing a neuropeptide Y receptor.

11. Use of a peptide derivative or a pharmaceutically acceptable salt thereof obtainable according to a process of any one of claims 1 to 8 or of a mixture thereof for the preparation of a pharmaceutical composition for the treatment of hypertension.

12. Use of a peptide derivative or a pharmaceutically acceptable salt thereof obtainable according to a process of any one of claims 1 to 8 or of a mixture thereof for the preparation of a pharmaceutical composition for the treatment of angina.

13. Use of a peptide derivative or a pharmaceutically acceptable salt thereof obtainable according to a process of any one of claims 1 to 8 or of a mixture thereof for the preparation of a pharmaceutical composition for the suppression of appetite.

14. Use of a peptide derivative or a pharmaceutically acceptable salt thereof obtainable according to a process of any one of claims 1 to 8 or of a mixture thereof for the preparation of a pharmaceutical composition for the treatment of vasospasm.
